ExESS Workflows – Do More with Less

Tired of repeating the same actions to complete a specific task?

Not anymore with ExESS' Workflow module!
ExESS' workflows help to efficiently perform a series of activities
in one click and eliminate human error.

With a graphic & intuitive user interface, the Workflow module provides the utmost flexibility to organize and customize your automated processes.
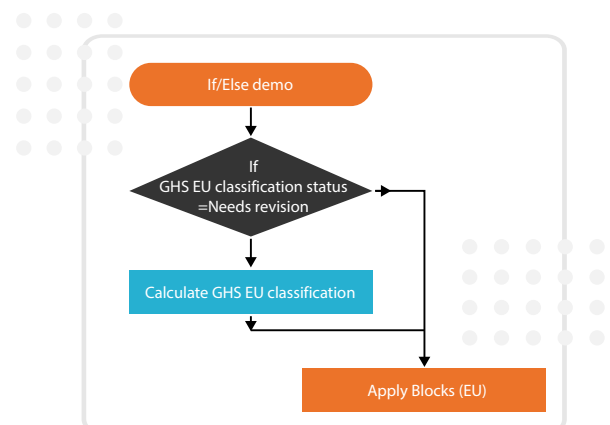

Our low-code integration & Drag and Drop features enable users of all levels to easily create their own automated flows without needing programming skills or advanced technical knowledge.

Custom Rules & Logic

By implementing your own custom rules and logic, you will instruct the system on how to carry out a specific action and how to move from one task to another.

Example of Workflow:

If GHS EU Classification Status equals 'Needs Revision'. Then Calculate GHS EU Classification, **Else,** "Apply block sequences".

Whether you activate it manually or based on a trigger, you have plenty of options to control the launch of a specific workflow process from a button to External tools, Webservices or save triggers.

01

02

03

Step 1

Choose your process

Step 2
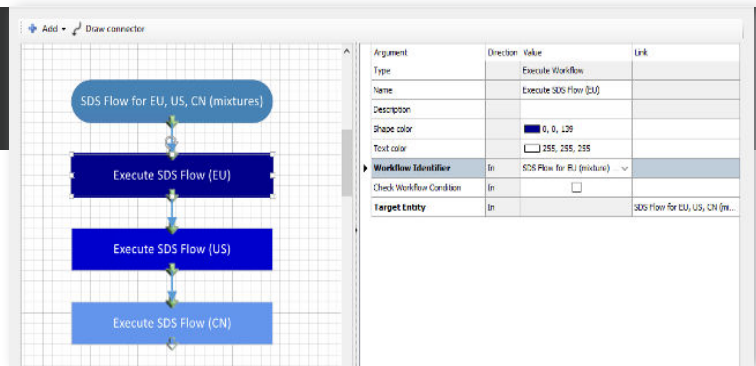

Define the activities and conditions

Step 3

Execute your workflow

Also execute Workflows within Workflows to complete more complex actions.

Shift the task fulfilment from human action to full automation and
save all the resources you would normally assign to project maintenance.

Choose the workflow module to handle your daily tasks more efficiently than ever before:

Save time

Ensure accuracy

Boost productivity
